8.2.2. Configure Syslog	26
8.3. Configuring Minion	26
8.3.1. Verifying Connectivity	27

Chapter 1. Installation Overview

The *OpenNMS* platform can be installed in several ways. This guide describes the installation of the platform on *Red Hat Enterprise Linux (RHEL)*-based, *Debian*-based and *Microsoft Windows* operating systems. The following abbreviations will be used to refer to the following operating systems:

- RHEL: Red Hat Enterprise Linux 6 or higher, CentOS 6 or higher, Fedora 20 or higher
- Debian: Debian 7 or higher, Ubuntu 14.04 or higher
- Microsoft Windows: Windows 8.1, Windows Server 2012, Windows 10

Installable, precompiled software packages are provided through *RHEL Yum* and *Debian APT* repository servers and from the OpenNMS Sourceforge project page. Installing *OpenNMS* requires the following prerequisites:

- A configured Yum or APT Package Repository for your platform (Linux only)
- Internet access to download and verify *OpenNMS* packages from the Yum or APT package repositories
- Oracle Java SE Development Kit 8 environment
- PostgreSQL database version 9.1 or higher
- A time-series database engine to persist long-term performance data:
 - JRobin: The default choice. JRobin is included inside OpenNMS and doesn't require additional software to be installed.
 - RRDtool: A higher performance, file-based database.
 - Newts: The highest performance solution. Newts uses an Apache Cassandra database for clustered scalability.

OpenJDK 8 can be used, but for production and critical environments Oracle Java SE Development Kit 8 is recommended.

\${OPENNMS_HOME} will be used to refer to the path where *OpenNMS* is installed. It is different depending on your platform:

- RHEL: /opt/opennms
- Debian: /usr/share/opennms
- Microsoft Windows: C:\Program Files\opennms

With the *opennms* meta package all dependencies needed for the components mentioned above are maintained. The following sections describe how to install *OpenNMS* on a single system. Dependencies for *Java* and the *PostgreSQL* database are maintained with the *opennms* meta installation package.

Chapter 2. Yum/APT Package Repositories

Installation packages are available for different releases of *OpenNMS*. You need to choose which release you would like to run and then configure your package repository to point to that release. Configuring a package repository will enable you to install and update the software by using standard Linux software update tools like *yum* and *apt*.

The following package repositories are available:

Table 1. OpenNMS package repositories

Release	Description
stable	Latest stable release. This version is recommended for all users.
testing	Release candidate for the next stable release.
snapshot	Latest successful development build, the "nightly" build.
branches/\${BRANCH- NAME}	Install from a specific branch name for testing a specific feature that is under development. Available branches can be found in http://yum.opennms.org/branches/ or http://debian.opennms.org/dists/branches/.

To install a different release the repository files have to be installed and manually modified.

2.1. RHEL Yum Repository

Install the configuration for a package repository

```
rpm -Uvh http://yum.opennms.org/repofiles/opennms-repo-${RELEASE}-rhel7.noarch.rpm ①
rpm --import http://yum.opennms.org/OPENNMS-GPG-KEY
```

① Replace \${RELEASE} with a release name like stable (recommended), testing, or snapshot.

2.2. Debian APT Repository

Create a new apt source file (eg: /etc/apt/sources.list.d/opennms.list), and add the following 2 lines:

Package repository configuration for Debian-based systems

```
deb http://debian.opennms.org ${RELEASE} main ①
deb-src http://debian.opennms.org ${RELEASE} main ①
```

① Replace \${RELEASE} with a release name like stable (recommended), testing, or snapshot.

Import the packages' authentication key with the following command:

wget -O - http://debian.opennms.org/OPENNMS-GPG-KEY | apt-key add -

Chapter 3. OpenNMS

After configuring the package repository, you are ready to install the *OpenNMS* packages, configure the database, and initialize the *OpenNMS* platform.

3.1. RHEL

This section describes how to install the *OpenNMS* platform on *CentOS 7.1*. The setup process is described in the following steps:

- 1. Installation of the *opennms* meta package which handles all dependencies
- 2. Initialize PostgreSQL database and configure access
- 3. Initialize *OpenNMS* and first start of the application

3.1.1. Install OpenNMS

Installation of the full application with all dependencies like PostgreSQL and Java

yum -y install opennms

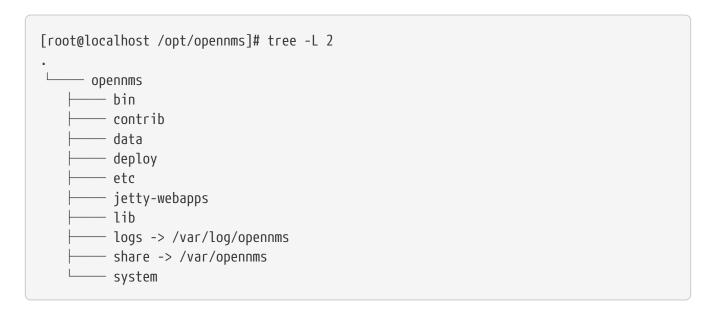

The following packages will be automatically installed:

- *opennms*: The platform meta package which handles all dependencies from *OpenNMS* repository.
- *jicmp6* and *jicmp*: *Java* bridge to allow sending *ICMP messages* from *OpenNMS* repository.
- opennms-core: OpenNMS core services, e.g. Provisiond, Pollerd and Collectd from OpenNMS repository.
- opennms-webapp-jetty: OpenNMS web application from OpenNMS repository
- jdk1.8: Oracle Java SE Development Kit 8 environment from OpenNMS respository
- postgresql: PostgreSQL database server from distribution repository
- postgresql-libs: PostgreSQL database from distribution repository

Verify the version of the *OpenNMS* packages that was installed with yum info opennms.

With the successful installed packages the *OpenNMS* platform is installed in the following directory structure:

3.1.2. Prepare PostgreSQL

The *CentOS* package installs but doesn't initialize the *PostgreSQL* database directory. Additionally *OpenNMS* requires authentication to access the database and are described in this section. Initialize the database directory with

Initialization of the PostgreSQL database

```
postgresql-setup initdb
```

System startup configuration for PostgreSQL

```
systemctl enable postgresql
```

Startup PostgreSQL database

```
systemctl start postgresql
```

The next step is setting the *postgres* super user password and creating an *opennms* database user with password. Additionally it is required to configure the authentication method to allow authentication from the local network.

Accounting and database management for OpenNMS

```
su - postgres
createuser -P opennms
createdb -O opennms opennms
exit
```

Set password for Postgres super user

```
su - postgres
psql -c "ALTER USER postgres WITH PASSWORD 'YOUR-POSTGRES-PASSWORD';"
exit
```

The super user is required to be able to initialize and change the database schema for installation and updates.

To allow *OpenNMS* access to the database over the local network *PostgreSQL* has to be configured.

```
vi /var/lib/pgsql/data/pg_hba.conf
```

Configuration of network access for PostgreSQL

```
host all all 127.0.0.1/32 md5 ①
host all all ::1/128 md5 ①
```

① Change method from ident to md5 for IPv4 and IPv6 on localhost.

Apply configuration changes for PostgreSQL

```
systemctl reload postgresql
```

In the next step configure the *OpenNMS* database configuration.

```
vi ${OPENNMS_HOME}/etc/opennms-datasources.xml
```

Configuration for database authentication in OpenNMS

- ① Set the user name to access the *OpenNMS* database table
- ② Set the password to access the *OpenNMS* database table

- 3 Set the postgres user for administrative access to PostgreSQL
- 4 Set the password for administrative access to PostgreSQL

3.1.3. Initialize OpenNMS

OpenNMS is now configured to access the database. It is required to set the *Java* environment running *OpenNMS* and initialize the database schema.

Configuration of Java environment for OpenNMS

```
${OPENNMS_HOME}/bin/runjava -s
```

Initialization of database and system libraries

```
${OPENNMS_HOME}/bin/install -dis
```

System startup configuration for OpenNMS

systemctl enable opennms

Startup OpenNMS

systemctl start opennms

After starting *OpenNMS* the web application can be accessed on <a href="http://<ip-or-fqdn-of-your-server">http://<ip-or-fqdn-of-your-server>:8980/opennms. The default login user is *admin* and the password is initialized to *admin*.

Change the default admin password to a secure password immediately.

3.2. Debian

This guide does not apply to OpenNMS Meridian, which can be installed only on Red Hat Enterprise Linux or CentOS systems.

This section describes how to install the *OpenNMS* platform on *Ubuntu 14.04 LTS*. The setup process is described in the following steps:

- 1. Installation of the *opennms* meta package which handles all dependencies
- 2. Initialize *PostgreSQL* database and configure access
- 3. Initialize *OpenNMS* and first start of the application

3.2.1. Install OpenNMS

Installation of the full application with all dependencies like PostgreSQL and Java

```
apt-get update
apt-get install -y opennms
```

The following packages will be automatically installed:

- *opennms*: The platform meta package which handles all dependencies from *OpenNMS* repository.
- *jicmp6* and *jicmp*: *Java* bridge to allow sending *ICMP messages* from *OpenNMS* repository.
- opennms-core: OpenNMS core services, e.g. Provisiond, Pollerd and Collectd from OpenNMS repository.
- opennms-webapp-jetty: OpenNMS web application from OpenNMS repository
- jdk1.8: Oracle Java 8 environment from OpenNMS respository
- postgresql: PostgreSQL database server from distribution repository
- postgresql-libs: PostgreSQL database from distribution repository

Verify the version of the *OpenNMS* packages that was installed with apt-cache show opennms.

With the successful installed packages the *OpenNMS* platform is installed in the following directory structure:

3.2.2. Prepare PostgreSQL

The *Debian* package installs also *PostgreSQL* database and is already initialized and added in the runlevel configuration. It is only necessary to start the *PostgreSQL* database without a restart.

Startup PostgreSQL database

```
service postgresql start
```

The next step is creating an *opennms* database user with password and configure the authentication method.

Accounting and database management for OpenNMS

```
su - postgres
createuser -P opennms
createdb -O opennms opennms
exit
```

It is not necessary to change the authentication method in pg_hba.conf, it is by default set to md5 for localhost connections.

Set password for Postgres super user

```
su - postgres
psql -c "ALTER USER postgres WITH PASSWORD 'YOUR-POSTGRES-PASSWORD';"
exit
```

0

The super user is required to be able to initialize and change the database schema for installation and updates.

```
vi ${OPENNMS_HOME}/etc/opennms-datasources.xml
```

Configuration for database authentication in OpenNMS

- ① Set the user name to access the *OpenNMS* database table
- ② Set the password to access the *OpenNMS* database table
- 3 Set the *postgres* user for administrative access to PostgreSQL
- 4 Set the password for administrative access to PostgreSQL

3.2.3. Initialize OpenNMS

OpenNMS is now configured to access the database. It is required to set the *Java* environment running *OpenNMS* and initialize the database schema.

Configuration of Java environment for OpenNMS

\${OPENNMS_HOME}/bin/runjava -s

Initialization of database and system libraries

\${OPENNMS_HOME}/bin/install -dis

It is not necessary to add *OpenNMS* to the run level manually, it is automatically added after setup.

Startup OpenNMS

service opennms start

After starting OpenNMS, the web application can be accessed on http://<ip-or-fqdn-of-your-server>:8980/opennms. The default login user is *admin* and the password is initialized to *admin*.

Change the default admin password to a secure password immediately.

3.3. Microsoft Windows

This guide does not apply to OpenNMS Meridian, which can be installed only on Red Hat Enterprise Linux or CentOS systems.

OpenNMS is mostly developed on Unix/Linux based systems, nevertheless it is possible to install the platform on *Microsoft Windows* operating systems. To install the application a graphical installer is provided and can be used to install *OpenNMS* on *Microsoft Windows*. This section describes how to install the *OpenNMS* platform on *Microsoft Windows 2012 Server*.

- The standalone installer for *Microsoft Windows* is only available for the most recent stable version of *OpenNMS*.
- It is required to have Oracle JDK 8 installed. The JRE is **NOT** sufficient.
- To edit *OpenNMS* configuration files on *Microsoft Windows* the tool Notepad++ can deal with the formatting of *.property* and *.xml* files.

The setup process is described in the following steps:

1. Installation of *PostgreSQL* database service

- 2. Download and install the graphical OpenNMS installer
- 3. First start of the *OpenNMS* application

3.3.1. Install PostgreSQL

PostgreSQL is available for *Microsoft Windows* and latest version can be downloaded from Download PostgreSQL page. Follow the on-screen instructions of the graphical installer.

The placeholder {PG-VERSION} represents the *PostgreSQL* version number. A version of *9.1*+ is required for *OpenNMS*.

The following information has to be provided:

- Installation directory for *PostgreSQL*, e.g. C:\Program Files\PostgreSQL{PG-VERSION}
- Password for the database superuser (*postgres*), this password will be used during the *OpenNMS* setup.
- Port to listen for *PostgreSQL* connections, default is 5432 and can normally be used.
- Locale for the database, keep [Default locale], if you change the locale, *OpenNMS* may not be able to initialize the database.

It is not required to install anything additional from the *PostgreSQL Stack Builder*.

The database data directory is automatically initialized during the setup and the *postgresql-x64-{PG-VERSION}* is already added as service and automatically started at system boot.

It is not necessary to change the authentication method in pg_hba.conf, it is by default set to md5 for localhost connections.

3.3.2. Install OpenNMS with GUI installer

For *Microsoft Windows* environments download the *standalone-opennms-installer-{ONMS-VERSION}.zip* file from the OpenNMS SourceForge repository. Extract the downloaded *ZIP* file.

The {ONMS-VERSION} has to be replaced with the latest stable version.

Start the graphical installer and follow the on screen instructions. The following information has to be provided:

- Path to Oracle JDK, e.g. C:\Program Files\Java\jdk1.8.0_51
- Installation path for *OpenNMS*, e.g. C:\Program Files\OpenNMS
- Select packages which has to be installed, the minimum default selection is *Core* and *Docs*
- PostgreSQL Database connection
 - Host: Server with *PostgreSQL* running, e.g. localhost

- Name: Database name for *OpenNMS*, e.g. opennms
- Port: TCP port connecting to PostgreSQL server, e.g. 5432
- Username (administrative superuser): PostgreSQL superuser, e.g. postgres
- Password (administrative superuser): Password given during *PostgreSQL* setup for the superuser
- Username (runtime user for opennms): Username to connect to the *OpenNMS* database, e.g. opennms
- Password (runtime user for opennms): Password to connect to the *OpenNMS* database, e.g. opennms
- Configure a discovery range for an initial node discovery. If you don't want any discovery set begin and end to the same unreachable address.

Choose secure passwords for all database users and don't use the example passwords above in production.

There is currently an open issue in the installer NMS-7831. Username and password are not written to the opennms-datasources.xml file and has to be changed manually. The initialize of the database will fail with an authentication error.

Configuration for database authentication in OpenNMS

- ① Set the user name to access the *OpenNMS* database table
- ② Set the password to access the *OpenNMS* database table
- ③ Set the *postgres* user for administrative access to PostgreSQL
- 4 Set the password for administrative changes of the *OpenNMS* database table

After setting the username and passwords in opennms-datasources.xml re-run the graphical installer and also initialize the database. *OpenNMS* can be started and stopped with the start.bat and stop.bat script located in %OPENNMS_HOME%\bin directory.

After starting *OpenNMS* with the start.bat file the web application can be accessed on http://<ip-orfqdn-of-your-server>:8980/opennms. The default login user is *admin* and the password is initialized to *admin*.

Change the default admin password to a secure password immediately.

The Wiki article Configuring OpenNMS as Windows Service describes how to create a *Windows Service* from the start.bat files. There is also a Java Wrapper which allows to install *Java* applications as *Windows Service*.

Chapter 4. Oracle Java SE Development Kit 8

Installing the *Oracle Java SE Development Kit 8 (JDK8)* requires installation packages provided by *Oracle* or a 3rd-party maintainer for *Debian*-based Linux distributions. The following tools should be installed to follow this installation manual:

- Download files and tools with wget and curl
- Extract archives with tar
- Text manipulation with sed
- Editing text, e.g. vi, nano or joe
- · Internet access

By downloading the *Oracle Java SE Development Kit 8* RPM installer, you will accept the license agreement from *Oracle* which can be found on the Java distribution web site.

4.1. RHEL

This section describes how to install *Oracle Java SE Development Kit 8* on a *RPM-based* system like *Red Hat Enterprise Linux 7* or *CentOS 7.1*.

Download Oracle JDK RPM

Install Oracle JDK RPM file

```
yum install /tmp/jdk-8-linux-x64.rpm
```

4.2. Debian

This section describes how to install *Oracle Java SE Development Kit 8* on a *Debian-based* system like *Debian 8* or *Ubuntu 14.04 LTS*.

Add Java repository from webupd8 maintainer

```
su -
echo "deb http://ppa.launchpad.net/webupd8team/java/ubuntu trusty main" | tee
/etc/apt/sources.list.d/webupd8team-java.list
echo "deb-src http://ppa.launchpad.net/webupd8team/java/ubuntu trusty main" | tee -a
/etc/apt/sources.list.d/webupd8team-java.list
```

Add repository key server and update repository

```
apt-key adv --keyserver hkp://keyserver.ubuntu.com:80 --recv-keys EEA14886 apt-get update
```

Install Oracle Java SE Development Kit 8

```
apt-get install -y oracle-java8-installer
```

4.3. Microsoft Windows

This section describes how to install *Oracle Java SE Development Kit 8* on a system running the *Microsoft Windows Server 2012* operating system.

Download the Microsoft Windows Java SE Development Kit 8 installer with PowerShell or a browser

```
cd C:\Users\Administrator\Downloads
Invoke-WebRequest http://javadl.sun.com/webapps/download/AutoDL?BundleId=107944
-Outfile java8-installer.exe
```

Start the java8-installer.exe from the command line or with *Windows Explorer* from the Administrator's *Download* folder.

The setup requires administrative privileges.

4.4. Java Environment

To locate the *Java* system files, applications typically use the \$JAVA_HOME environment variable. The environment can be set for a specific user or globally for the whole system on boot time.

Example path to Java on RHEL, Debian and Microsoft Windows systems

- RHEL: /usr/java/jdk1.8.0_51
- Debian: /usr/lib/jvm/java-8-oracle
- Microsoft Windows: C:\Program Files\Java\jre1.8.0_51

4.4.1. Set JAVA_HOME on Linux

Option 1: Set the Java environment for the current user

```
vi ~/.bash_profile
export JAVA_HOME=/path/to/java
```

Option 2: Set the Java environment for all users on boot time

```
vi /etc/profile
export JAVA_HOME=/path/to/java
```

4.4.2. Set JAVA_HOME on Microsoft Windows

Option 1: Set JAVA_HOME as user specific system variable

```
setx "JAVA_HOME" "path\to\java"
```

Option 2: Set JAVA_HOME as a System variable

setx /M "JAVA_HOME" "path\to\java"

Chapter 5. RRDtool

In most *Open Source* applications, RRDtool is often used and is the de-facto open standard for *Time Series Data*. The basic installation of *OpenNMS* comes with *JRobin* but it is simple to switch the system to use *RRDtool* to persist *Time Series Data*. This section describes how to install *RRDtool*, the *jrrd2 OpenNMS Java Interface* and how to configure *OpenNMS* to use it. *RRDtool* can be installed from the official package repositories provided by *RHEL* and *Debian* based *Linux* distributions.

5.1. RHEL

Installation on RHEL/CentOS

yum install rrdtool

5.2. Debian

Installation of RRDtool on Debian/Ubuntu

apt-get install rrdtool

5.3. Source

If you want the latest version of RRDtool, you may want to compile it from source. Instructions for doing so are at <u>rrdbuild</u>.

The latest version of RRDtool may not always be compatible with the version of *OpenNMS* that you want to run. Please ask about RRDtool support on the discussion lists or chat rooms if you have any problems running a new version of RRDtool.

If you want to install the latest *RRDtool* from source, make sure the rrdtool binary is in search path. To make the setup easier, you can link the binary to /usr/bin/rrdtool which is the location where *OpenNMS* will expect to find the executable binary.

5.4. Install jrrd2 Interface

To get access from the *OpenNMS Java Virtual Machine* you have to install *jrrd2* as an interface. You can install it from the *OpenNMS* package repository with:

Installation of jrrd2 on RHEL/CentOS

yum install jrrd2

apt-get install jrrd2

With OpenNMS 17.0.0 it is preferred to use *jrrd2* instead of *jrrd*. The *jrrd2* module is improved for performance by adding multithreading capabilities.

5.5. Configure OpenNMS Horizon

To configure *OpenNMS* to use *RRDtool* instead of *JRobin* configure the following properties in rrd-configuration.properties.

Configuration of RRDtool in OpenNMS on RHEL/CentOS

```
org.opennms.rrd.strategyClass=org.opennms.netmgt.rrd.rrdtool.MultithreadedJniRrdStrate
gy
org.opennms.rrd.interfaceJar=/usr/share/java/jrrd2.jar
opennms.library.jrrd2=/usr/lib64/libjrrd2.so
```

Configuration of RRDtool in OpenNMS on Debian/Ubuntu

```
org.opennms.rrd.strategyClass=org.opennms.netmgt.rrd.rrdtool.MultithreadedJniRrdStrate
gy
org.opennms.rrd.interfaceJar=/usr/share/java/jrrd2.jar
opennms.library.jrrd2=/usr/lib/jni/libjrrd2.so
```

OpenNMS expects the *RRDtool* binary in /usr/bin/rrdtool.

Table 2. References to the RRDtool binary

Configuration file	Property
opennms.properties	rrd.binary=/usr/bin/rrdtool
response-adhoc- graph.properties	command.prefix=/usr/bin/rrdtool
response-graph.properties	<pre>command.prefix=/usr/bin/rrdtool info.command=/usr/bin/rrdtool</pre>
snmp-adhoc- graph.properties	command.prefix=/usr/bin/rrdtool
snmp-graph.properties	<pre>command.prefix=/usr/bin/rrdtool command=/usr/bin/rrdtool info</pre>

Chapter 6. Newts

Newts is a time-series data store based on Apache Cassandra. *Newts* is a persistence strategy, that can be used as an alternative to JRobin or RRDtool.

It is currently not supported to initialize the *Newts* keyspace from *Microsoft Windows Server* operating system. *Microsoft Windows* based *Cassandra* server can be part of the cluster, but keyspace initialization is only possible using a _Linux-_based system.

6.1. Setting up Cassandra

It is recommended to install *Cassandra* on a dedicated server, but is also possible to run a node on the *OpenNMS Horizon* server itself. This installation guide describes how to set up a single *Cassandra* instance for evaluating and testing *Newts*. These steps are not suitable for a high performance production *Cassandra Cluster*. For further information see *Cassandra Getting Started Guide*. If you already have a running cluster you can skip this section.

6.1.1. RHEL

This section describes how to install the latest *Cassandra 2.1.x* release on a *RHEL* based systems for *Newts*. The first step is to add the *DataStax* community repository and install the required *GPG Key* to verify the integrity of the *RPM packages*. After that install the package with *yum* and the *Cassandra* service is managed by *Systemd*.

This description was built on RHEL 7 and CentOS 7.1.

Add the DataStax repository

```
vi /etc/yum.repos.d/datastax.repo
```

Content of the datastax.repo file

```
[datastax]
name = "DataStax Repo for Apache Cassandra"
baseurl = http://rpm.datastax.com/community
enabled = 1
gpgcheck = 1
```

Install GPG key to verify RPM packages

```
rpm --import http://rpm.datastax.com/rpm/repo_key
```

Install latest Cassandra 2.1.x package

```
yum install dsc21
```

Enable Cassandra to start on system boot

```
chkconfig cassandra on
```

Start cassandra service

service cassandra start

Verify whether the *Cassandra* service is automatically started after rebooting the server.

6.1.2. Debian

This section describes how to install the latest *Cassandra 2.1.x* release on a *Debian*-based system for *Newts*. The first step is to add the *DataStax* community repository and install the required *GPG Key* to verify the integrity of the *DEB packages*. After that install the packages with *apt* and the *Cassandra* service is added to the runlevel configuration.

This description was built on Debian 8 and Ubuntu 14.04 LTS.

Add the DataStax repository

```
vi /etc/apt/sources.list.d/cassandra.sources.list
```

Content of the cassandra.sources.list file

```
deb http://debian.datastax.com/community stable main
```

Install GPG key to verify DEB packages

```
wget -O - http://debian.datastax.com/debian/repo_key | apt-key add -
```

Install latest Cassandra 2.1.x package

```
apt-get update apt-get install dsc21=2.1.10-1 cassandra=2.1.10
```

The *Cassandra* service is added to the runlevel configuration and is automatically started after installing the package.

Verify whether the *Cassandra* service is automatically started after rebooting the server.

6.1.3. Microsoft Windows

This section describes how to install the latest *Cassandra 2.1.x* release on a *Microsoft Windows Server* based systems for *Newts*. The first step is to download the graphical installer and register *Cassandra* as a *Windows Service* so it can be manged through the *Service Manager*.

This description was built on Windows Server 2012.

Download the DataStax graphical installer for Cassandra from PowerShell or a Browser

```
cd C:\Users\Administrator\Downloads
Invoke-WebRequest http://downloads.datastax.com/community/datastax-community-
64bit_2.1.10.msi -Outfile datastax-community-64bit_2.1.10.msi
```

Run the Windows Installer file from *PowerShell* or through *Windows Explorer* and follow the setup wizard to install. During the installation, accept the options to automatically start the services. By default the *DataStax Server*, *OpsCenter Server* and the *OpsCenter Agent* will be automatically installed and started.

- 0
- The *DataStax OpsCenter Server* is only required to be installed once per *Cassandra Cluster*.
- 0

If you install the *DataStax OpsCenter* make sure you have *Chrome* or *Firefox* installed.

6.2. Configure OpenNMS Horizon

Once *Cassandra* is installed, *OpenNMS Horizon* can be configured to use *Newts*. To enable and configure *Newts*, set the following properties in \${OPENNMS_HOME}/etc/opennms.properties:

Configuration for OpenNMS Horizon

```
# Configure storage strategy
org.opennms.rrd.storeByForeignSource=true
org.opennms.timeseries.strategy=newts

# Configure Newts time series storage connection
org.opennms.newts.config.hostname=$ipaddress$
org.opennms.newts.config.keyspace=newts
org.opennms.newts.config.port=9042
```

The org.opennms.newts.config.hostname property also accepts a comma separated list of hostnames and or IP addresses.

Once Newts has been enabled, you can initialize the Newts schema in Cassandra with the following:

Initialize Newts keyspace in Cassandra

```
${OPENNMS_HOME}/bin/newts init
```

Optionally, you can now connect to your *Cassandra* cluster and verify that the keyspace has been properly initialized:

Verify if the keyspace is initialized with cqlsh

```
cqlsh
use newts;
describe table terms;
describe table samples;
```

Restart *OpenNMS Horizon* to apply the changes.

Chapter 7. R Statistics System

R is a free software environment for statistical computing and graphics. *OpenNMS* can leverage the power of R for forecasting and advanced calculations on collected time series data.

OpenNMS interfaces with R via stdin and stdout, and for this reason, R must be installed on the same host as OpenNMS. Note that installing R is optional, and not required by any of the core components.

The *R* integration is not currently supported on *Microsoft Windows* systems.

7.1. RHEL

This section describes how to install *R* on a *RHEL* based system.

This description was built on RHEL 7 and CentOS 7.1.

Install the EPEL repositories

yum install epel-release

Install R

yum install R

7.2. Debian

This section describes how to install *R* on a *Debian*-based system.

This description was built on *Debian 8* and *Ubuntu 14.04 LTS*.

Install R

sudo apt-get install r-recommended

Chapter 8. OpenNMS Minion

Minion gives enterprises the ability to create a globally distributed, scalable monitoring fabric.

Support for *Minion* is currently *experimental* and packages are only available for RHEL-based systems.

Before attempting to setup *Minion*, you must have an instance of *OpenNMS* set up using the same version of the packages.

Minion can be installed on the same system as *OpenNMS* or on other systems provided that it can communicate with:

- 1. The OpenNMS REST interface
- 2. The ActiveMQ broker used by OpenNMS

8.1. RHEL

This description was built on RHEL 7 and CentOS 7.1.

8.1.1. Install Minion

Start by setting up the OpenNMS Yum repository and installing Java.

OpenNMS Minion currently requires a JDK. See HZN-620 for details.

Once the Yum repository has been configured:

Install the Minion packages

```
yum -y install opennms-minion
```

The following packages will be automatically installed:

- *opennms-minion*: The Minion meta package
- *opennms-minion-container*: The *Karaf* OSGi container with *Minion* branding and additional management extensions
- opennms-minion-features-core: Core utilities and services required by the Minion features
- opennms-minion-features-default: Service-specific features

The *Minion* packages setup the following directory structure:

8.1.2. Initialize Minion

System startup configuration for Minion

```
systemctl enable minion
```

Startup Minion

```
systemctl start minion
```

After starting *Minion* the shell can be accessed locally on ssh://localhost:8201. The default login user is *admin* and the password is initialized to *admin*.

```
[root@localhost /root]# $ ssh -p 8201 admin@localhost
```

8.2. Configuring OpenNMS

Some configuration is necessary on OpenNMS to allow it to receive data from an OpenNMS Minion.

8.2.1. Configure ActiveMQ

OpenNMS embeds an *ActiveMQ* broker which, by default, cannot be accessed remotely via the network. In order to make the *ActiveMQ* broker accessible remotely, you must edit \$OPENNMS_HOME/etc/opennms-activemq.xml and uncomment the transportConnector with the tcp://0.0.0.0:61616 URI.

```
<!-- Uncomment this line to allow external TCP connections -->
<!--
WARNING: Access to port 61616 should be firewalled to prevent unauthorized injection
of data into OpenNMS when this port is open.
-->
<transportConnector name="openwire" uri="tcp://0.0.0.0:61616?useJmx=false
&amp;maximumConnections=1000&amp;wireformat.maxFrameSize=104857600"/>
```

If you wish to restrict ActiveMQ connections to only one particular external IP address, you can

8.2.2. Configure Syslog

To process syslog messages received by a Minion device, you must install the opennms-syslogd-handler-default component on OpenNMS.

Configure the opennms-syslogd-handler-default module on OpenNMS

```
[root@localhost /root]# $ ssh -p 8101 admin@localhost
...
admin@minion()> config:edit org.opennms.netmgt.syslog.handler.default
admin@minion()> config:propset brokerUri tcp://127.0.0.1:61616
admin@minion()> config:update
admin@minion()> features:install opennms-syslogd-handler-default
```

8.3. Configuring Minion

This section describes how to configure *Minion* once it has been installed and started.

Once the *Minion* service is started and the *Karaf* shell is accessible, you can configure the *Minion* to point it at your *OpenNMS* instance.

By default the *Minion* is configured to communicate with *OpenNMS* via localhost.

Configure the Minion's location and URLs for communication with OpenNMS

```
[root@localhost /root]# $ ssh -p 8201 admin@localhost
...
admin@minion()> config:edit org.opennms.minion.controller
admin@minion()> config:property-set http-url http://opennms-fqdn:8980/opennms
admin@minion()> config:property-set broker-url tcp://opennms-fdqn:61616
admin@minion()> config:property-set location RDU
admin@minion()> config:update
```

Configure the credentials to use when communicating with OpenNMS

```
admin@minion()> scv:set opennms.http admin admin
admin@minion()> scv:set opennms.broker admin admin
```

Restart the Minion after updating the credentials

```
[root@localhost /root]# $ systemctl restart minion
```

The credentials are configured separately since they are encrypted on disk.

8.3.1. Verifying Connectivity

Once the URLs and credentials for communicating with the *OpenNMS* instance are configured, you can verify connectivity using:

Verify connectivity with the OpenNMS controller

```
admin@minion()> minion:ping
Connecting to ReST...

OK
Connecting to Broker...

OK
admin@minion()>
```
